### General description of sensor function:

The Sensor is sensitive to AC and DC current and can be used for fault current detection in IC-CPD applications. The Sensor detects fault currents according to UL2231-2 Ed.2. In the event of a 5mA rms fault current, PIN 3 will change its state from a low level (GND) to high impedance state. In the event of an 20mA rms fault current, PINs 3 and 4 will change state from a low level (GND) to a high impedance state. Error conditions (e.g. an internal error) are signaled by PIN 1 (ERROR-OUT) which changes state to high impedance.

#### PIN description:

PIN No.	Description
PIN 1 → ERROR-OUT (open collector output)	If no system fault is detected, the output PIN 1 is at low level (GND). If a system fault is detected, PIN is at high impedance state. In this case, PINs 3 and 4 will be set to a high impedance state too (see tab.1).
PIN 2 → TEST-IN (refer to Fig. 2)	A function test including an offset measurement (this value is stored in EEPROM for further calculation) is activated if this PIN is connected to GND for a period of 40ms to 1.2s. If the PIN is set to GND less than 40ms or more than 1.2s, no function test will be performed.  Attention: During the functional test and offset measurement, no differential current shall flow.  To ensure high accuracy of the sensor this test shall be activated at regular intervals (e.g. at startup, before measuring...).  If a push-pull switch is used, the voltage range must be 0V...5V.
PIN 3 → X5-OUT (open collector output)	If the residual current is below 5mA rms and no system fault occurs the output on PIN 3 is a low level (GND). In any other case output PIN 3 is in a high impedance state. If PIN 4 is high impedance, PIN 3 will also be set to high impedance (see tab. 1).
PIN 4 → X20-OUT (open collector output)	If the residual current is below the 20mA rms and no system fault occurs the output on PIN 4 is a low level (GND). In any other case PINs 3 and 4 is in a high impedance state (see tab. 1).
PIN 5 → GND	Ground connection
PIN 6 → VCC	Positive supply voltage
PIN 7 → PWM-OUT	Acc. to the DC component of residual current a duty-cycle with f=8kHz is generated. This is for monitoring purposes only and shall not be used to switch the power relay.  Refer to SPWM-OUT = 2%/mA
PIN 8 → N.C.	Not connected

**Typical application diagram:**

$I_C$	Collector current (PINs 1, 3 and 4)	50	mA
$V_{CC}$	Maximum supply voltage (without function)	-0.3	7
$U_{MAX}$	Maximum rated voltage of primary conductors	250	V
$V_{TEST-IN, low}$	TEST-IN Input Voltage, low level	0	0.6
$V_{TEST-IN, high}$	TEST-IN Input Voltage, high level	2.5	5

<sup>(6)</sup>Stresses above these ratings may cause permanent damage.  
Exposure to these conditions for extended periods may degrade device reliability.  
Functional operation of the device at these or any other conditions beyond those specified is not supported.

**Figures:**

**Fig. 1: Meaning of switching recovery level**

If the trip-level  $I_{\Delta N1}/I_{\Delta N2}$  is accomplished the corresponding output X5-OUT/X20-OUT will change its state from low-level (GND) to high impedance. Depending on the existence of the differential current  $I_{\Delta}$ , the outputs X5-OUT/X20-OUT will remain in their states until  $I_{\Delta}$  is below the recovery threshold  $I_{\Delta R1}/I_{\Delta R2}$ .

After activating the test sequence, the end product has to monitor the correct state of the switching outputs being used at the following points in time

- M1: check that 5mA rms OUT is disabled (latest time)
- M2: check that 20mA rms OUT is disabled
- M3: check that 20mA rms OUT resp. 5mA rms OUT is enabled

**Fig. 2: Power-Up timing diagram**

**Fig. 3: Interrupting Time according to UL2231-2 Ed.2, page 30, fig. 6 and typical values of sensor**

**Fig. 4: UL2231 response value over frequency**

X5-OUT	X20-OUT	ERROR-OUT	State
GND	GND	GND	Normal condition
High impedance	GND	GND	$I_{\Delta N1} \geq 5mA_{rms}$
High impedance	High impedance	GND	$I_{\Delta N2} \geq 20mA_{rms}$
High impedance	High impedance	High impedance	Error, system fault

All other conditions not mentioned in the table are not possible. If these conditions occur, the sensor is an unknown state and describes an Error.
